**How Unisys used Logikcull
to Eliminate Investigation
Roadblocks and Produce
Significant Savings**

Problem Statement

Prior to Logikcull, Unisys' legal team relied on manual searches of employee inboxes to identify information relevant to internal investigations. That process often involved sifting through up to 60 subfolders at a time, copying items of interest to a separate folder, and then using a flash drive to transfer that folder to the supervising attorney. The Unisys team described the process as "perfectly horrible." It was not unusual for investigations to drag on for days.

Key Challenges

- Time required to create manual searches of employee mailboxes
- Many repetitive and time consuming process steps
- Investigation timelines are extended due to manual processes

How Challenges Were Addressed

Logikcull's drag-and drop feature, which places email and other responsive documents directly into an easily accessible cloud-based platform, automatically processes and categorizes them for the investigation. The team was able to identify and review materials quickly using Logikcull's carousel filter which works like Amazon.com. The bulk tag was feature was used to quickly categorize both relevant content and low-value data.. Additionally, Logikcull made it easy to invite attorneys and other team members into the platform so they can review materials collaboratively or on their own.

The Results of Using Logikcull

Logikcull's ease of use, accessibility and automated features have resulted in huge time savings for the Unisys legal department. Logikcull has helped the IT giant cut the time it takes to respond to internal investigations and subpoenas by more than 75% and, considering the billable rates of its renowned outside attorneys, Logikcull has saved the company many thousands of dollars annually on document review alone.
